SUMMARY:

Full-stack engineer with 6+ years shipping production web UIs and the services behind them, focused on design engineering: owning features from user feedback and problem framing through UI design, production code, and post-launch iteration. Designs and builds reusable React/TypeScript component architectures, data visualizations, and dashboards for enterprise tools that operations teams rely on every day. Prototypes in code with AI daily (Gemini API, GitHub Copilot, LLM-assisted development), turning ideas into working demos for client stakeholders. At home in large shared codebases: git, pull requests, code review, and CI/CD.

SKILLS:

Product Design & UI: UI design ownership, user flows, interaction design, user feedback & iteration, design in code, rapid prototyping, reusable component architecture, data visualization, responsive & accessible design

Frontend: TypeScript, JavaScript, React.js, React Hooks, Redux, Material UI (MUI), Theming, WebGL, Interactive Maps, HTML, CSS, Jest

Backend & Data: Node.js, Express.js, Java, Spring Boot, Python, REST APIs, Microservices, Apache Kafka, SQL, MySQL, MongoDB, JWT, OAuth2, GIS/Geospatial Data

AI Tools & Workflows: GitHub Copilot, LLM-Assisted Development, Google Gemini API, Prompt Engineering, AI Prototyping, RAG, Agentic Workflows, AI-Driven Code Review

Engineering Practice: Git, Pull Requests & Code Review, CI/CD (Jenkins), Docker, Kubernetes, AWS, Grafana, Prometheus, Agile/Scrum

WORK EXPERIENCE:

Verizon (Incedo Inc.), Dallas, TX

Full Stack Developer

June 2024 - Present

- Owned UI design and front-end build for the revamp of an enterprise network-operations portal: talked directly with ops users to understand their workflows and pain points, designed directly in code, demoed working builds to users and iterated on their feedback, shipping a modular React/TypeScript architecture that cut code redundancy 25%.
- Built a shared component library on Material UI (React, TypeScript) with a common theme for color, spacing, and type, giving every page of the portal consistent patterns.
- Kept iterating after launch based on user and client feedback: reworked navigation and filters, simplified dense layouts, and fixed slow views, reducing clicks and screens for common tasks and lowering bugs and support tickets.
- Designed and built reusable React components and custom data visualizations that render Kafka topic flows in real time, turning dense operational data into views ops teams can act on.
- Prototyped in code with AI: designed and demoed an end-to-end GenAI proof-of-concept (Google Gemini API) that evolved the platform from a reporting dashboard into a next-best-action and root-cause-analysis assistant, presenting the working prototype directly to client stakeholders.
- Built AI-enabled internal workflows, including Gemini-powered code-quality review prompts that flag code smells, vulnerabilities, and standards violations, reducing defects.
- Designed and built Grafana/Prometheus dashboards for Kafka health (consumer lag, throughput, broker health), improving system reliability 20% through faster root-cause diagnosis.
- Designed and built interactive map views with WebGL-rendered markers for thousands of network sites, plus GeoServer-backed GIS diff maps showing added and removed coverage between data loads.
- Built the Node.js/Express REST APIs and microservices behind the platform, plus Python scripts that ingest county boundaries and multi-source data for the map views.
- Owned production deployments end to end (scripts, DB updates, validation), earning Best Deliverables recognition; served as onshore SME and mentored teammates on AI-assisted development standards.

T-Mobile, Dallas, TX

Java Developer

July 2023 - May 2024

- Designed and built front-end components for a subscription-management dashboard in React and Redux, focused on responsiveness and accessibility and validated with Jest, lifting user satisfaction 40%.
- Worked with product managers and QA in Agile sprints to turn requirements into designs, and led code reviews to keep frontend and backend standards consistent.
- Built Spring Boot REST microservices for subscription activation, usage tracking, and billing, with Spring Eureka service discovery behind a single API gateway.
- Implemented Kafka event-driven messaging for real-time activity logging and notifications; secured APIs with JWT and role-based access control.
- Optimized SQL queries and schema design, cutting query execution time 20%.

University of North Texas, Denton, TX

Graduate Teaching Assistant

Sept 2022 - May 2023

- Co-designed interactive coursework with faculty across functional programming, test automation, and Foundations of Computing/AI, lifting student engagement 20%.
- Authored guides and hands-on projects that raised student comprehension 15%, and mentored students on applied programming practices.

TracFone Wireless, Hyderabad, India

Software Developer

Jan 2019 - November 2021

- Built Model-View-Controller (MVC) applications in Spring Framework, integrating SOAP and RESTful services with Spring Boot microservices; translated 20+ user stories into system designs with a Scrum team.
- Improved database efficiency 30% by rewriting slow SQL queries and analyzing execution plans.
- Cut post-deployment issues 30% with 100+ JUnit/Mockito tests and Postman validation; streamlined Jenkins/Docker CI/CD, reaching 95% on-time delivery for key features.

EDUCATION:

Master of Science in Computer Science (MS), University of North Texas, Denton, TX — GPA: 3.9/4.0

PROJECTS:

RAG Pipeline for Multi-Source Data Consumption

- Built a Python Retrieval-Augmented Generation (RAG) pipeline that ingests, validates, and consolidates data from heterogeneous sources, with data contracts enforcing schema consistency.
- Enabled natural-language querying over data that previously required manual cross-referencing across systems.

Natural-Language Multi-Source Data Retrieval Agent

- Prototyped an AI agent that takes a plain-language question and orchestrates calls across multiple data sources, returning one consolidated answer, exploring how to make multi-system data access simple for non-technical users.
- Explored agentic patterns (query parsing, source routing, response synthesis) as a proof-of-concept.
